ABSTRACT

A image of Neuroendocrine Tumor of the Uterine Neck was presented

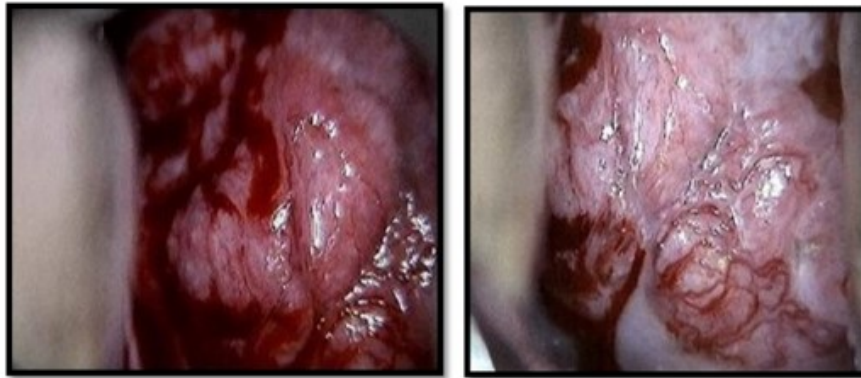

Keywords: Neuroendocrine Tumor, Uterine Neck

Content

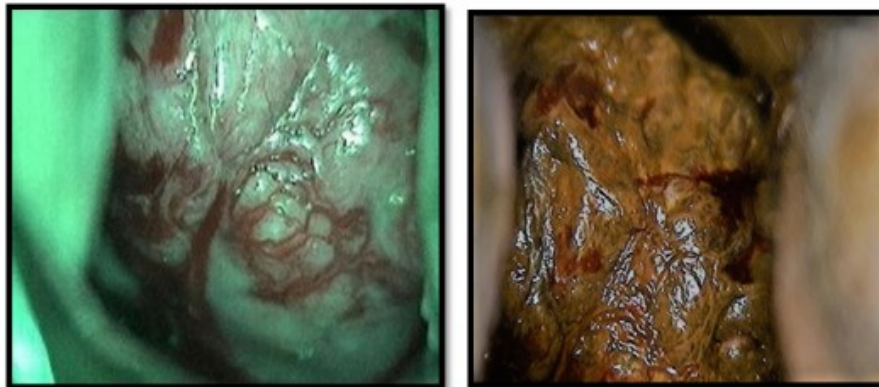

A 23-year-old female patient of mixed race, with a good health history and no reported toxic habits, came to the clinic with metrorrhagia of approximately one year's duration. Her obstetric history included four pregnancies, one normal delivery, and three induced abortions (G4 P1 A3).

Physical examination with a speculum revealed a cervical tumor measuring approximately 8 cm in diameter, extending to the middle third of the vagina. The tumor had an irregular surface and increased vascularization. After applying acetic acid, dense white epithelium and atypical vessels were observed. Schiller test: canary yellow. Vaginal examination revealed a cervical tumor measuring approximately 8 cm in diameter, with an irregular surface and increased consistency. The uterus was approximately 9 cm in size and had normal consistency, with non-palpable adnexa and a free fornix. Rectal examination revealed a normal perianal region, a tonic sphincter, and both parametria were infiltrated without reaching the pelvic wall. A diagnosis of a neuroendocrine tumor of the cervix was made, with clinical stage II B (Fig. 1 - Panel ABCD). Treatment with radiochemotherapy was planned .
